| Scope Details | |
|---------------------------------------|--|
| Main Species | Coho salmon (<i>Oncorhynchus kisutch</i>) |
| Stock | Coho salmon in FAO area 67 – northeast Pacific |
| Fishery Location | FAO 67 (Northeast Pacific) |
| Management Authority (Country/ State) | Alaska Department of Fish and Game (ADF&G), North Pacific Fishery Management Council (NPFMC), National Oceanic and Atmospheric Administration (NOAA) Fisheries |
| Gear Type(s) | Gillnets, entangling nets, seine nets, hook and lines, trolling lines, surrounding nets with purse lines, traps |
| Outcome of Assessment | |
| Peer Review Evaluation | Agree with assessor’s recommendation |
| Recommendation | Approved |

Table 2. Assessment Determination

| Assessment Determination |
|--|
| <p>If any species is categorised as Endangered or Critically Endangered on Union for Conservation of Nature's Red List of Threatened Species - IUCN's Red List, or if it appears in the Convention on International Trade in Endangered Species of Wild Fauna and Flora - CITES appendices, it cannot be approved for use as MarinTrust raw material. Coho salmon (<i>Oncorhynchus kisutch</i>) is not categorised as Endangered or Critically Endangered on IUCN's Red List and does not appear in CITES appendices; therefore, coho salmon (<i>Oncorhynchus nerka</i>) eligible for approval for use as Marin Trust by-product raw material.</p> <p>The flag country of assessment is USA and almost all the sockeye salmon harvested there comes from Alaska fisheries. Coho salmon is certified by Marine Stewardship Council - MSC since 2000, together with other Alaska salmon species, such as chum salmon (<i>Oncorhynchus keta</i>), sockeye salmon (<i>Oncorhynchus nerka</i>) Chinook salmon (<i>Oncorhynchus tshawytscha</i>) and pink salmon (<i>Oncorhynchus gorbusha</i>) in FAO 18 - Arctic sea and FAO 67 - northeast Pacific. Alaska salmon fisheries are generally managed to achieve spawning escapement goals determined to ensure conservation and long-term sustainability. Coho salmon stock was assessed under Category C.</p> <p>Fishery removals are included in the stock assessment and it PASSES Clause C1.1. Overall, in 2021, most coho salmon stocks met escapement goals or surpassed them and coho salmon has never been classified as "Management concern" over the history in Alaska. Therefore, the stock PASSES Clause C1.2.</p> <p>Coho salmon (<i>Oncorhynchus kisutch</i>) in FAO area 67 - northeast Pacific is APPROVED for the production of fishmeal and fish oil under the current MarinTrust v2.3 by-products standard.</p> |
| Fishery Assessment Peer Review Comments |
| <p>The assessor correctly classified the coho salmon (<i>Oncorhynchus kisutch</i>) in FAO area 67 are under category C, as the stock is managed, and reference points (or proxy) are defined to assess the stock status against.</p> <p>Fishery removals are considered in the stock assessment process. The most recent stock assessment is considered to be above Blim as the majority of stocks are meeting or exceeding escapement goals. Therefore, the stock is considered to have biomass above the limit reference point.</p> <p>Therefore, the coho salmon in FAO area 67 passes both clauses (C1.1 and C1.2) and therefore should be APPROVED under the current MarinTrust V2.3 by-products standards.</p> |
| Notes for On-site Auditor |
| N/A |

Species Categorisation

NB: If any species is categorised as Endangered or Critically Endangered on the IUCN Red List, or if it appears in CITES Appendix 1, it **cannot** be approved for use as a MarinTrust raw material.

IUCN Red list Category

By-product material from a species listed by IUCN (the International Union for Conservation of Nature) under the Red List for the following categories shall immediately fail the assessment;

- EXTINCT (E) AND EXTINCT IN THE WILD (EW)
- CRITICALLY ENDANGERED (CR) facing an extremely high risk of extinction in the wild.
- ENDANGERED (EN) facing a very high risk of extinction in the wild.

By-product material may be used from the following categories provided that all clauses in the MarinTrust standard are passed.

- VULNERABLE (VU) facing a high risk of extinction in the wild.
- NEAR THREATENED (NT) does not qualify for above now, but is close or is likely to qualify for, a threatened category in the near future.
- LEAST CONCERN (LC) Widespread and abundant.
- DATA DEFICIENT (DD) and NOT EVALUATED (NE)

| | | | |
|---------------------|---|--|-----------------------------|
| Species Name | | Coho salmon (<i>Oncorhynchus kisutch</i>) | |
| C1 | Category C Stock Status - Minimum Requirements | | |
| | C1.1 | Fishery removals of the species in the fishery under assessment are included in the stock assessment process, OR are considered by scientific authorities to be negligible. | Yes |
| | C1.2 | The species is considered, in its most recent stock assessment, to have a biomass above the limit reference point (or proxy), OR removals by the fishery under assessment are considered by scientific authorities to be negligible. | Yes |
| | | | Clause outcome: Pass |

C1.1 Fishery removals of the species in the fishery under assessment are included in the stock assessment process, OR are considered by scientific authorities to be negligible.

The flag country of assessment is USA and almost all the coho salmon harvested there comes from Alaska fisheries. Alaska salmon fisheries are not managed through a Total Allowable Catch – TAC, but they are generally managed to achieve spawning escapement goals determined to ensure conservation and long-term sustainability.

Landings data for coho salmon are available online (Figure 1). According to The Alaska Department of Fish and Game’s - ADF&G the catches of coho salmon in 2022 were 1.9 million and the projected 2023 commercial harvests are expected to be 3.0 million (Donnellan et al, 2023).

Figure 1. Historical landings data for Alaska Salmons (ADFG, 2023).

Fishery removals of the species in the fishery under assessment are included in the stock assessment process, and are considered by scientific authorities to be negligible. C1.1 is met.

C1.2 The species is considered, in its most recent stock assessment, to have a biomass above the limit reference point (or proxy), OR removals by the fishery under assessment are considered by scientific authorities to be negligible.

Alaska fishery managers have the primary goal of maintaining spawning population sizes, not of reaching pre-season harvest projections. Alaska salmon fisheries are generally managed to achieve spawning escapement goals determined to ensure conservation and long-term sustainability. Escapement goals are defined in ranges which function as target reference points for fishery management. Goals are established for key reference species and stocks in each fishing area.

Currently, there are approximately 300 established escapement goals in Alaska. Each year, escapements for fishery stocks are reported in Area Management Reports. Since 2010, the department has produced a [publicly accessible report](#) that is a statewide compilation of salmon escapements and escapement goals. The most current report was published in August 2022 and covers escapements from 2013 to 2021 (Munro and Brenner, 2022). Escapements were compared against escapement goals in place at the time of enumeration to assess outcomes in achieving goals. Escapements for a particular stock were classed as “Under” if

escapement for a given year was less than the lower bound of the escapement goal. If escapement fell within the escapement goal range or was greater than a lower bound goal, they considered the goal “Met”. Where escapement exceeded the upper bound of an escapement goal range, it was classed as “Over”. Overall, most coho salmon stocks met escapement goals or surpassed them. The summary of the escapements review for sockeye salmon in 4 regions of Alaska is presented in Figure 2 and 3.

Figure 3. Source: Munro and Brenner (2022).

Where escapements chronically (4–5 years) fail to meet expectations for harvestable yield or spawning escapements, ADF&G may recommend—and the BOF may adopt— a Stock of Concern (SOC) designation for those underperforming salmon stocks. “Yield concerns” arise from a chronic inability to maintain expected yields or harvestable surpluses above escapement needs. “Management concerns” are precipitated by a chronic failure to maintain escapements within the bounds, or above the lower bound of the established goal. A “conservation concern” may arise from a failure to maintain escapements above a sustained escapement threshold. Coho salmon has never been classified as “Management concern” over the history in Alaska (Munro and Brenner, 2022).

MSC (2022) declared that “Spawning escapement goals are being met or exceeded the majority of the time for Alaska Salmon (Table 1). In a few cases where recent escapements have increasingly fallen below goals, long-term data indicates that numbers are fluctuating around target values (Appendix 1). It is generally not possible to meet escapement goals for every population all of the time due to normal variation in annual run sizes which is typical of salmon. This is true even in the absence of fishing.” (Figure 4).

Escapement Goal Achievement

Coho Salmon

Figure 4. Appendix 1 of the escapement goal achievement presentation performed by Andrew Munro ADF&G in MSC (2022).

The species is considered, in its most recent stock assessment, to have a biomass above the limit reference point (or proxy). C.1.2 is met.
